EDUCATION

Villanova University, PA

January 2019 - Present

Doctor of Philosophy Student in Computer Engineering
Department of Electrical and Computer Engineering

University of Science and Technology Beijing, China

September 2014 - June 2018

Bachelor of Engineering in Automation
School of Advanced Engineering

RESEARCH FOCUS

- Hyperdimensional Computing, Vector Symbolic Architectures, and Neuromorphic computing
- AI-powered Bio-informatics and Smart Health-care
- Electronic Design Automation and Approximate Computing

RESEARCH INSIGHTS

AI-Powered Bioinformatics, Biomedical Science and Smart Health (2020 – Now)

- Using neuromorphic computing schemes: brain inspired hyperdimensional computing for molecular property classification and develop ultra-low-cost model for drug discovery and pharmacology that shows comparable results with SOTA GNNs on multiple benchmark datasets such as SIDER, Clintox, and BBBP. (In Submission)
- Using transfer learning to apply SOTA deep learning models for task classification on older adults using functional Near-Infrared Spectroscopy (fNIRS) that increases more than 10% accuracy from traditional learning models. Using Pytorch framework and GPU to achieve acceleration on training and inference. (In Submission)

Brain Inspired Hyperdimensional Computing (2021 – Now)

- Implementing efficient spam text detection using hyperdimensional computing which achieve comparable accuracy with 30–115X model size compression (ISVLSI'21).
- Exploring error characteristics and propose mitigation methods on energy efficient hyperdimensional computing systems using voltage scaling (ASAP'21).
- Propose black-box and grey-box fuzz testing schemes to analyze robustness of hyperdimensional computing under adversarial samples (DAC'21, ISVLSI'21).

Approximate Computing (2019 – 2021)

- Propose methodologies leveraging data locality along with error tolerance to enable approximate computing on emerging applications.
- Implement computation memoization via emerging FeFET CAM to enable up to 60% energy saving on CNNs with minimal accuracy loss (GLVLSI'20).

- Design computation bypass logics on data-intensive applications such as image processing, vision transformers to enhance energy efficiency on multiple platforms such as GPU and FPGA (NANOARCH'19, DSD'20, ISQED'22).

Electronic Design Automation (2019 – 2021)

- Design and train machine learning algorithms to model dynamic timing delay and output errors of (approximate) functional units.
- Successfully predict dynamic timing delays and output errors of functional units under specific input with accuracy higher than 95% (TCAD'20, DAC'20, DSN'20, SELSE'20, TCAD'21).
- ML models help architects to obtain circuit timing or output information without the need of using complicated EDA toolchains, enabling concise design loop and faster verification and testing.
